## About the General Authority for Survey and Geospatial Information

## National Geospatial Center

A unified national reference for the governance of geospatial data, setting standards and controls to achieve the integrated use of the national geospatial information system, and organizing a mechanism for collecting, sharing, saving, updating, maintaining and disseminating geospatial data through a national geospatial platform according to easy, secure, upgradable and growing preservation and publishing principles.

# National Geospatial Center

# National Geospatial Platform

The screenshot shows the website's header with the GEOSA logo and contact information: Helpline 920000427 and Technical Support ngc@geosa.gov.sa. A navigation menu includes Interactive Map, Geospatial Governance, Geospatial Applications, and Digital Library. The main banner features the title 'National Geospatial Platform' and the subtitle 'The National Geospatial Data Infrastructure Window'. Below this, a paragraph describes the platform's purpose: 'Established to achieve maximum benefit from unifying efforts in geospatial data and integrating them through a national geospatial database and system available to all government agencies. The national geospatial platform benefits from and shares geospatial data in an easy and secure manner, and in accordance with national geospatial data policies to preserve rights and enhance the security of geospatial data.' A button labeled 'About Us' is visible. At the bottom of the banner, four service categories are listed with icons: Geospatial Data Request, Open Data, Geospatial Incidences, and KSA Official Map.

# **National Geospatial Data Governance**

## National Geospatial Data Governance

Creating and managing a comprehensive geospatial data governance that aligns with the requirements of users. This involves collaborating and coordinating with data producers to prepare data for publication, distribution, and exchange in adherence to national policies, standards, and industry best practices. **The goal is to ensure that all stakeholders, including decision makers and beneficiaries, can effectively utilize the data.**

Adopting global best practices in geospatial information

# National Geospatial Data Governance – Best Practices

# National Geospatial Data Policies – Classification

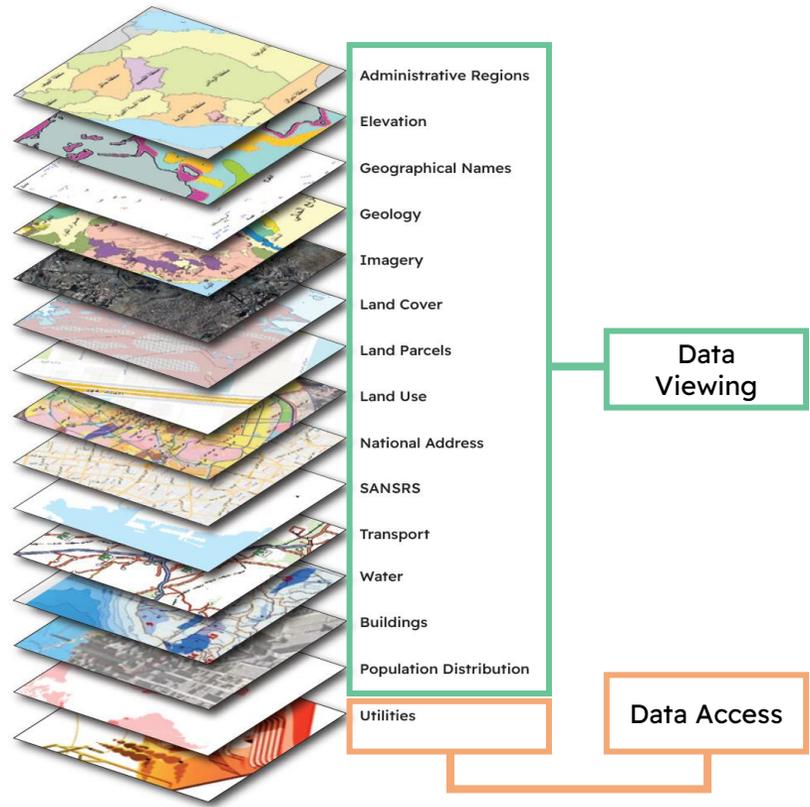

# National Geospatial Data Policies – Licensing

Derivative Data/App.  
Production

Data Access

Data Viewing

The minimum Licensing for the Foundation geospatial data is set, however different licensees can be granted based on the required use case.

# 📁 National Geospatial Data Policies – Pricing

## Pricing Models

Cost Recovery - #1

Cost Recovery + ROI - #2

## Government to Government

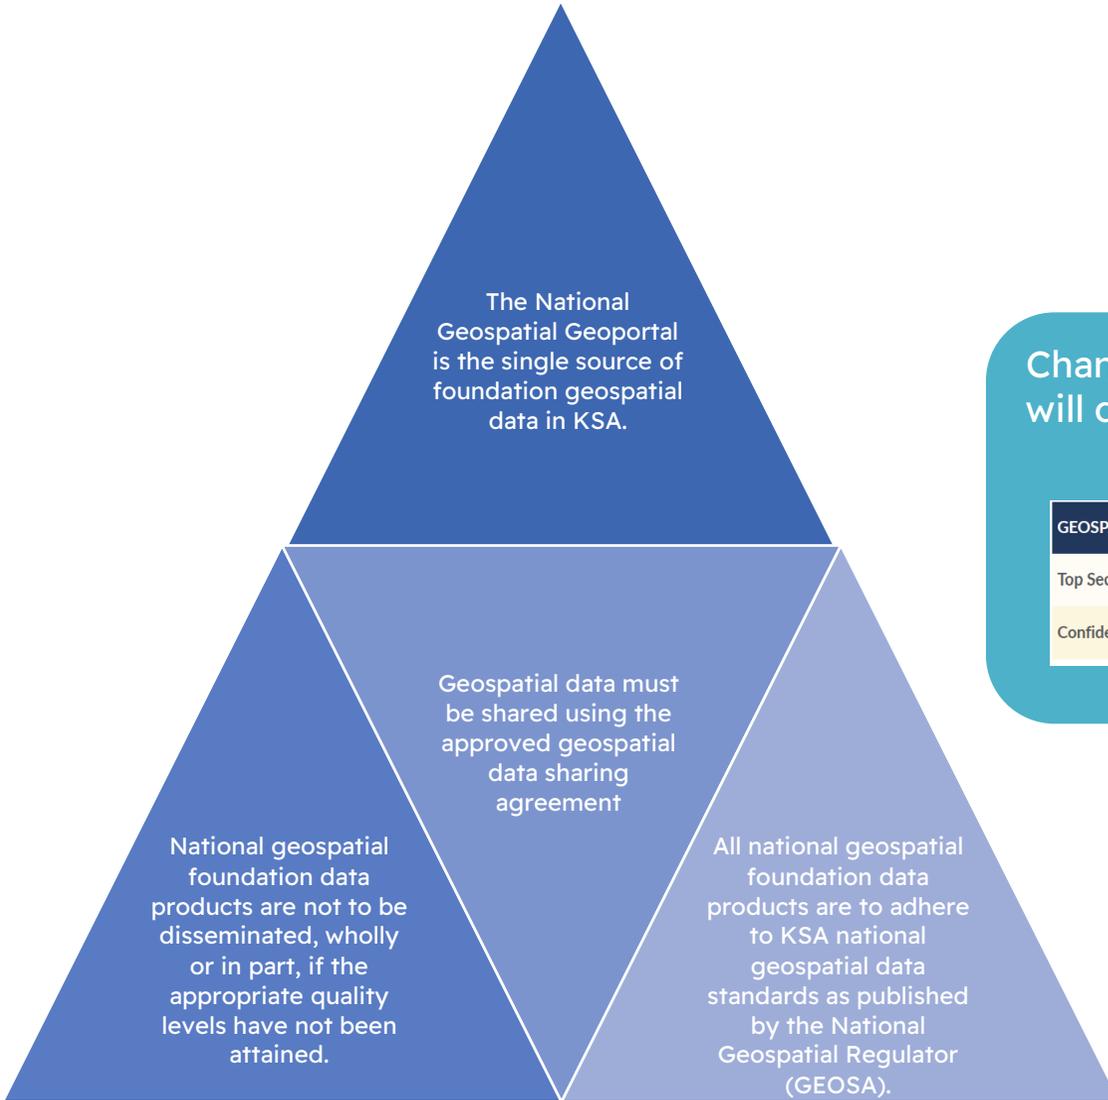

DATA TYPE	GEOSPATIAL DATA	GEOSPATIAL PRODUCTS
Open Geospatial Data	Free	Cost Recovery (Model#1)
Classified Geospatial Data (Confidential and higher)	Free	Cost Recovery (Model#1)

## Government to Business/Individuals

DATA TYPE	GEOSPATIAL DATA	GEOSPATIAL PRODUCTS
Open Geospatial Data	Free	Cost Recovery (Model#1)
Classified Geospatial Data (Confidential and higher)	Cost Recovery (Model#1)	Cost Recovery + ROI (Model#2)

# 📁 National Geospatial Data Policies – Sharing

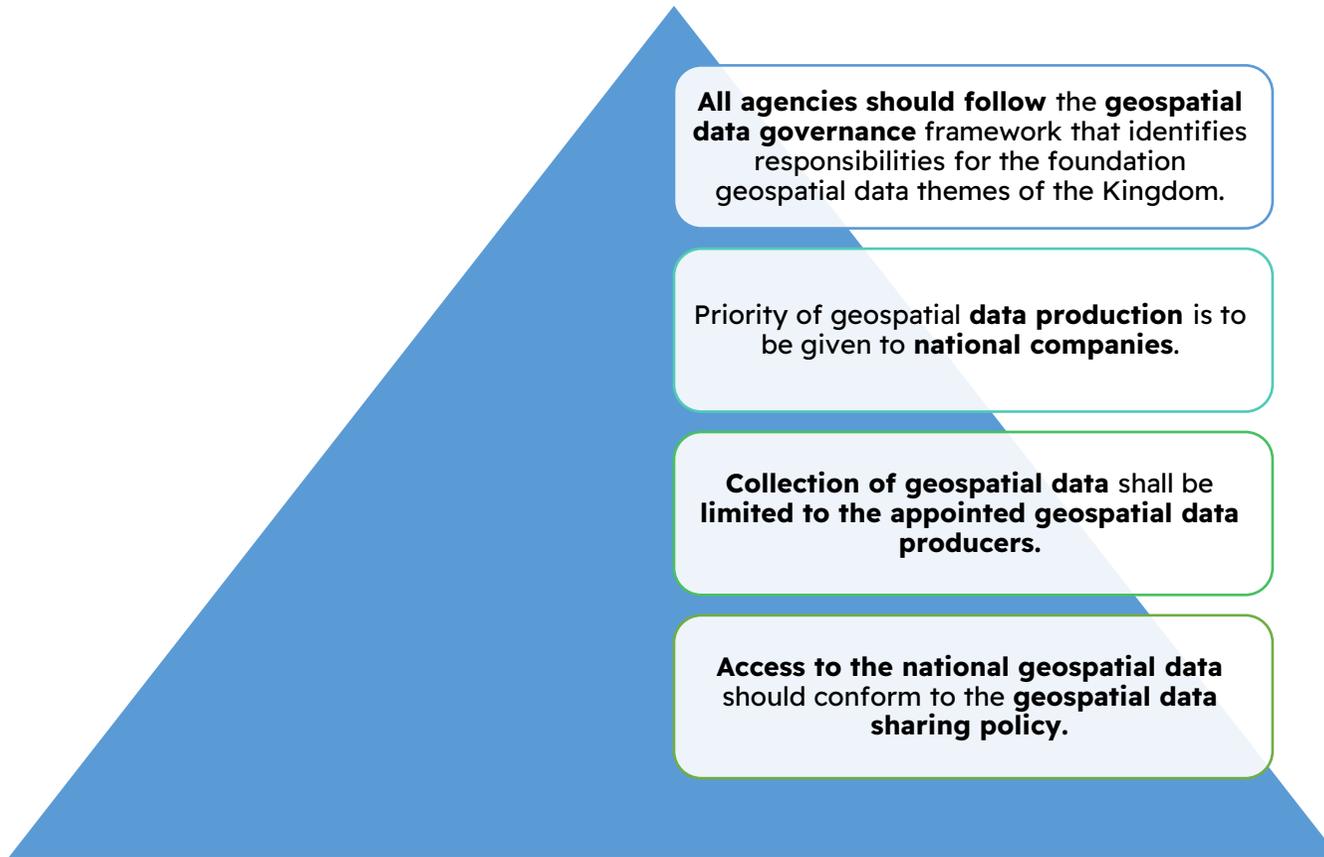

Channels for dissemination of a specific dataset will depend on the data classification as follows:

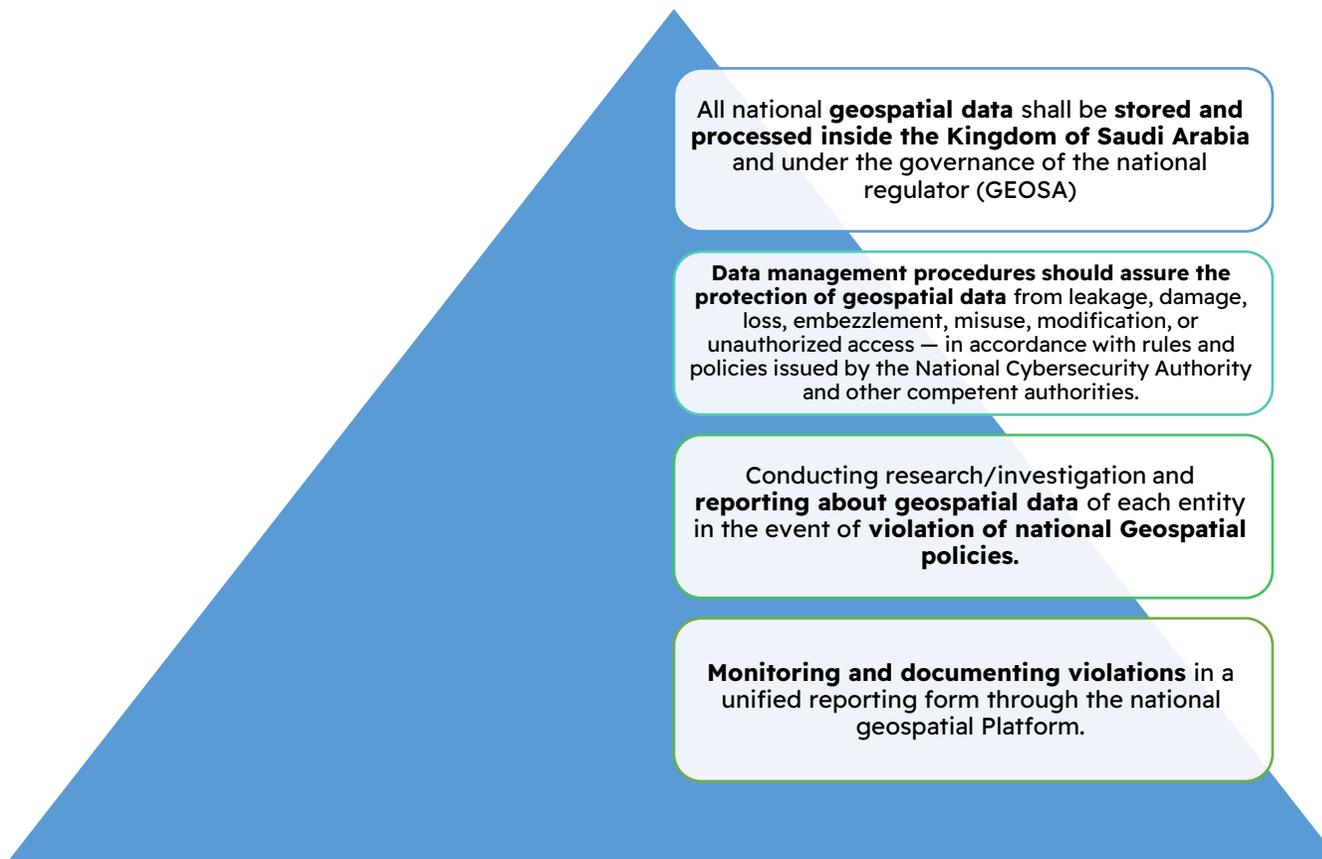

GEOSPATIAL DATA CLASSIFICATION	SHARING CHANNEL
Top Secret and Secret	Government Secure Network (GSN)
Confidential and Public	Geospatial Web Applications / Geospatial Web Services:

## National Geospatial Data Policies – Protection

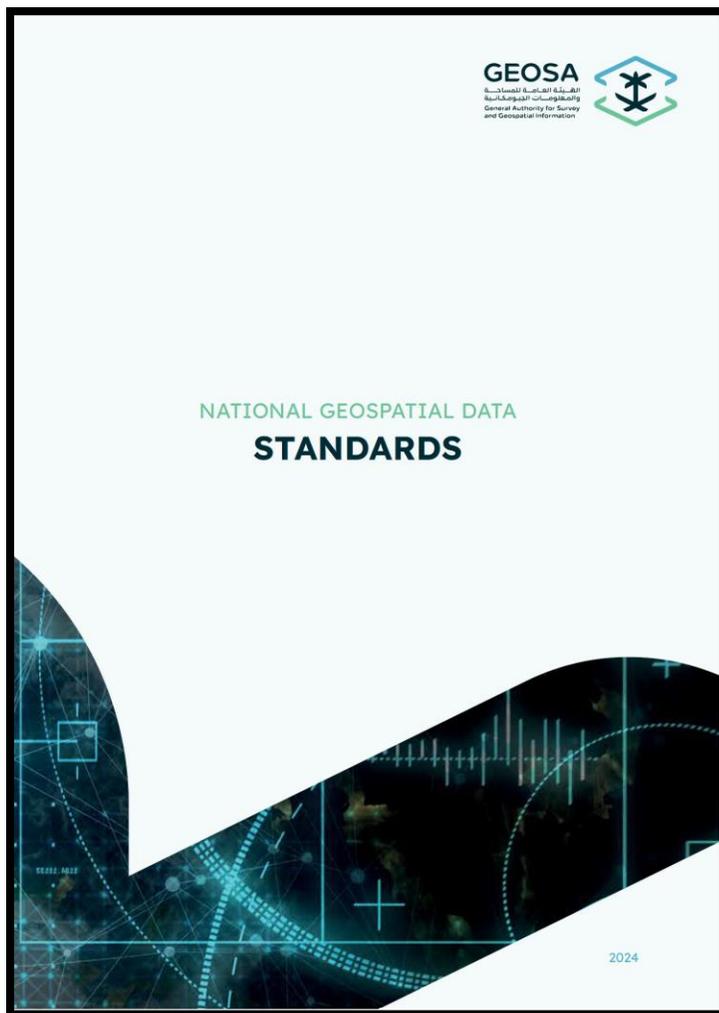

## National Geospatial Data Policies – Protection

# **National Geospatial Data Standards**

# 📖 National Geospatial Data Standards – Introduction

# National Geospatial Data Standards – Data Quality

## Data quality elements based on ISO 19157 standard

Temporal Quality

Logical Consistency

Thematic Quality

Positional Accuracy

Completeness

EXAMPLE		Foundation Theme
<b>National Address</b>		
<b>Geospatial Data Quality Requirements:</b>		
<b>Completeness</b>	All national address data must be at least 95% complete.	
<b>Positional Accuracy</b>	The spatial accuracy should not exceed 3 meters.	
<b>Thematic Accuracy</b>	The thematic Accuracy must be geographically precise, correctly assigned to appropriate locations, and compliant with standardized address formats or conventions. For example, linking address with accurate geographical features such as a building, house, or parcel of land within the locality.	
<b>Logical Consistency</b>	<ul style="list-style-type: none"> <li>Address components must match reality; for example, street names should match the actual streets, and building numbers should follow a standardized format.</li> <li>Check valid address ranges - if there are numbered buildings from 1 to 100 on the street, there should be no missing addresses or duplicate numbers within this range.</li> </ul>	
<b>Temporal Quality</b>	<ul style="list-style-type: none"> <li>Date acquisition data.</li> <li>Timely updates to ensure the addition of new addresses.</li> <li>The dataset may include historical addresses to provide a comprehensive record of address changes over time.</li> <li>The timeframe for updating the data is daily</li> </ul>	

EXAMPLE		Foundation theme
<b>Land Parcels</b>		
<b>Geospatial Data Quality Requirements:</b>		
<b>Completeness</b>	Land parcels and their components should be at least 85% complete.	
<b>Positional Accuracy</b>	Urban areas: minimum 25 cm Rural/agricultural areas: minimum 1.5 meters	
<b>Thematic Accuracy</b>	Attribute values associated with each land parcel, such as parcel size, location coordinates, ownership details, zoning information, and any other relevant attributes, are accurately represented and reflect the actual characteristics of the corresponding land parcels.	
<b>Logical Consistency</b>	<ul style="list-style-type: none"> <li>Check duplication of land parcel features.</li> <li>Check for invalid placement of land parcel features within a defined tolerance</li> <li>Check for invalid overlaps of land parcel features.</li> </ul>	
<b>Temporal Quality</b>	<ul style="list-style-type: none"> <li>Dates of data acquisition of land parcels.</li> <li>Types of updates.</li> <li>Validity period for the data.</li> <li>The timeframe for updating the data does not exceed one month</li> </ul>	

## National Geospatial Data Standards – Data Quality Evaluation

The elements of data quality assessment are based on the ISO 19157 standard, and the following requirements must be met in order to assess the quality of geospatial data:

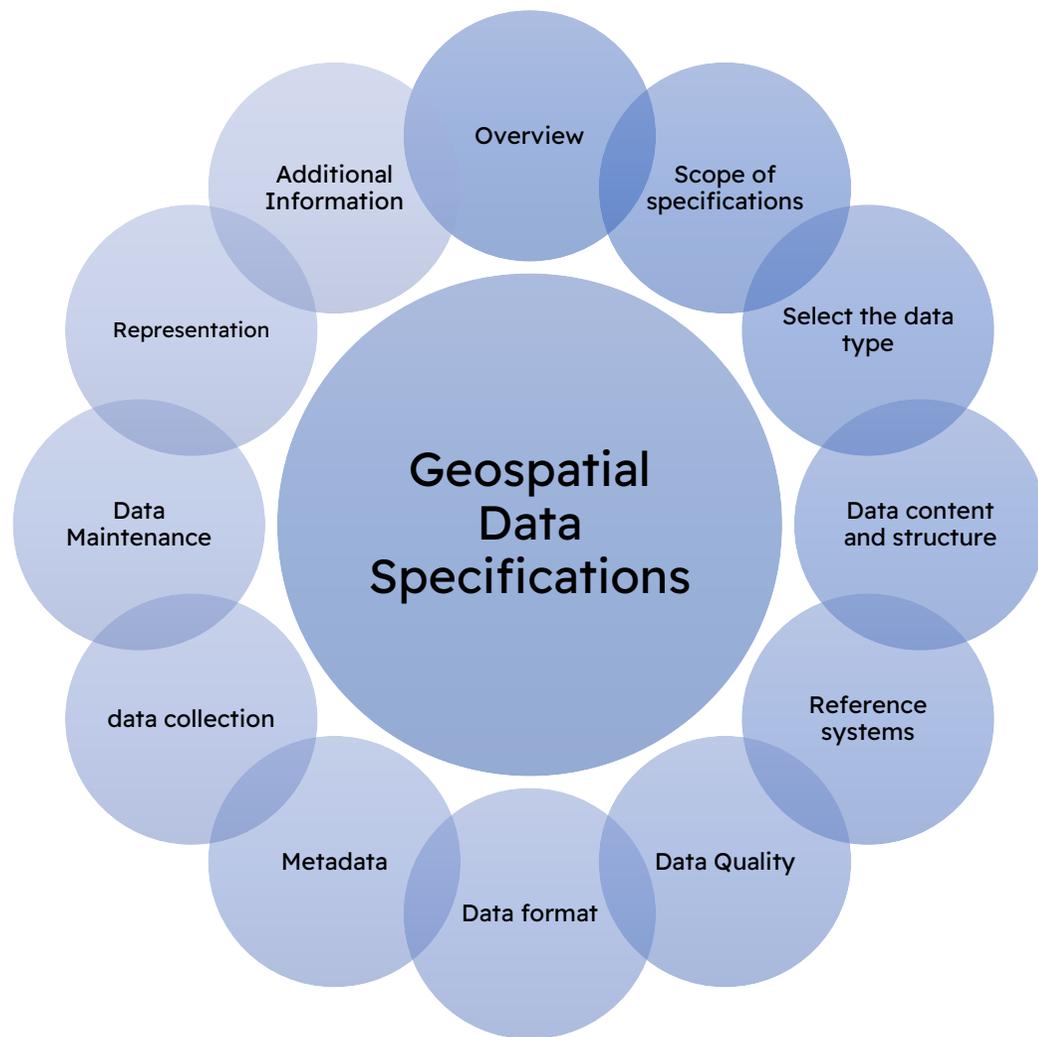

- **Reliability:** Credibility of the data quality test result.
- **Representation:** The degree of accuracy of the representation of the geospatial data sample.
- **Homogeneity:** Consistency of data quality test results.

Indirect evaluation

Direct Evaluation

## National Geospatial Data Standards – Data Specifications

An accurate technical detailed description of the dataset or dataset series as well as the information generated and provided by the geospatial data producer.

# National Geospatial Data Standards – Quality Management

Determine the required quality of data for a specific purpose and context to ensure that quality standards are met, as well as evaluate, document and disseminate quality-related information.

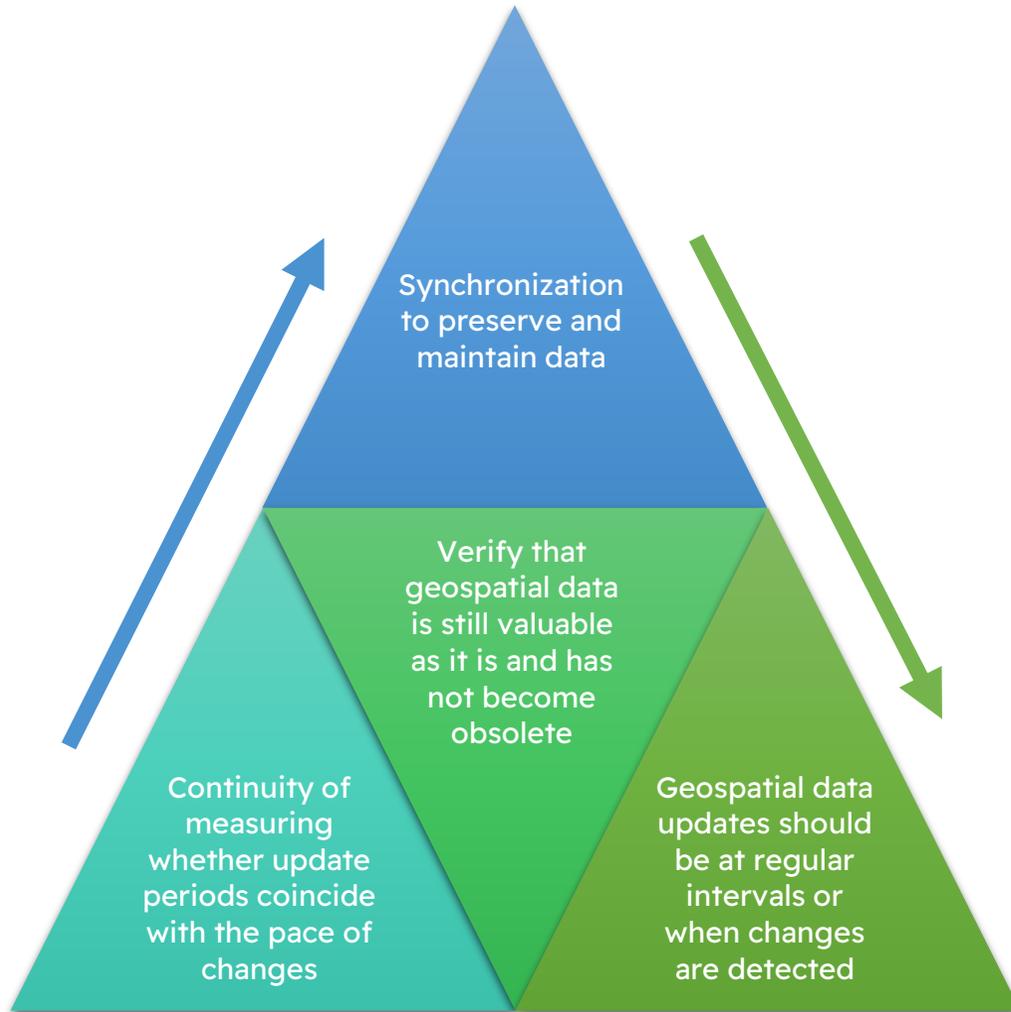

# National Geospatial Data Standards – Data Collection and Documentation

Geospatial data must be collected according to clear procedures and high transparency, to achieve the necessary reliability of geospatial data.

## 📁 National Geospatial Data Standards – Maintenance and Update

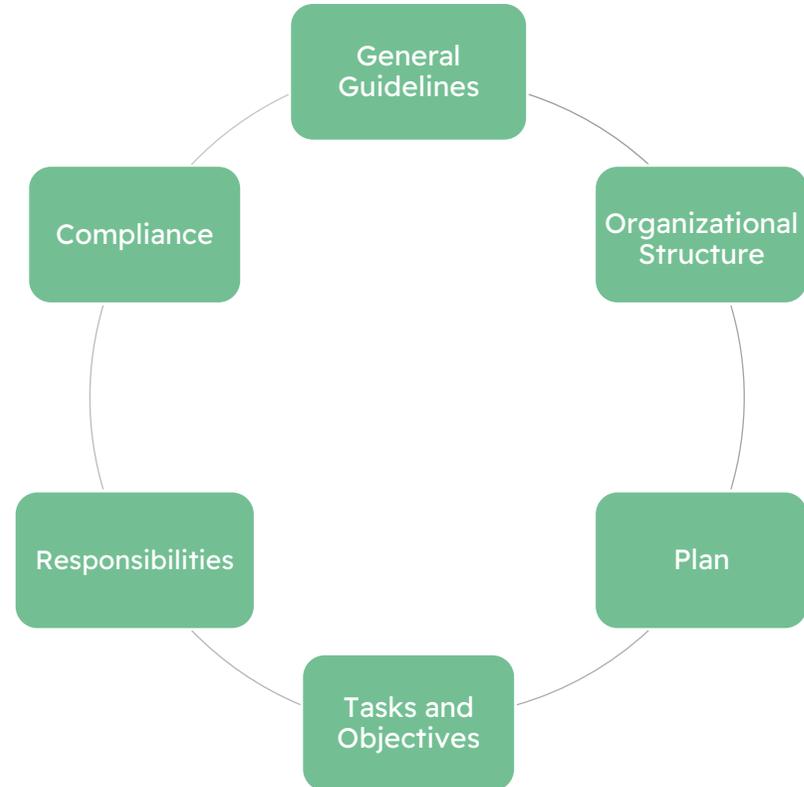

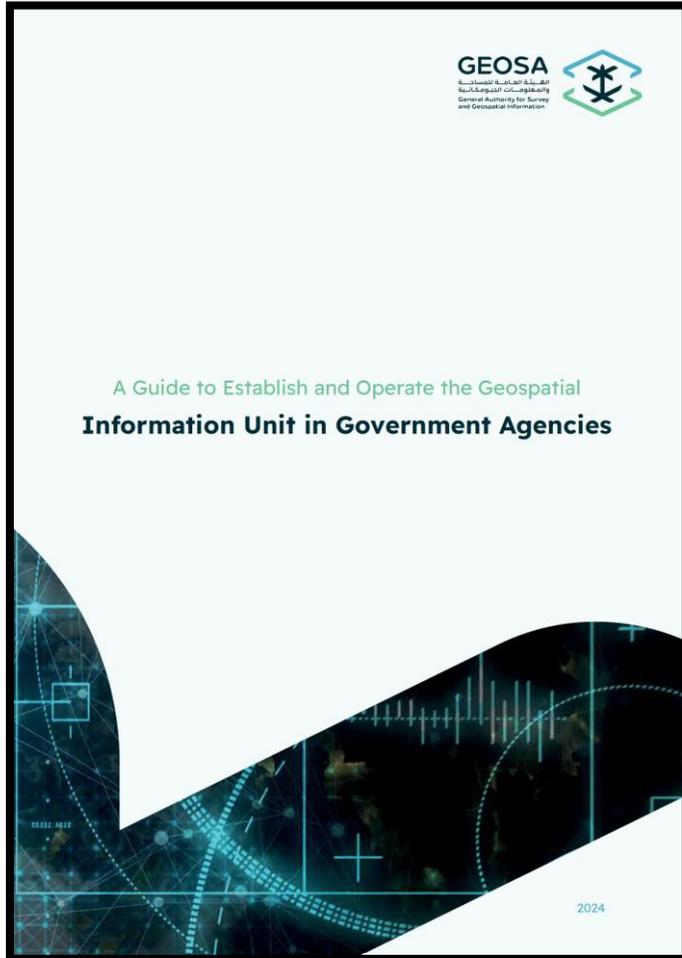

To maintain, maintain and update geospatial data, plans must be developed to ensure the maintenance and updating of geospatial data, including procedures, specifications and funding for the maintenance of the produced data, and the following basic principles must be followed for the maintenance and updating of geospatial data:

# A Guide to Establish and Operate Information Unit in Government Agencies

The guide contains five basic stages for the development of the geospatial information unit in government agencies through which it aims to work gradually, where the unit will initially be established (or re-established) in the first three stages (within 100 days), after that the activation phase of that unit will begin, which may take from one to three years, depending on the size of the entity and the role entrusted to it.

# A Guide to Establish and Operate Information Unit in Government Agencies

## Responsibilities (example)

Role	Main Tasks and Responsibilities	Qualifications
<b>Supervisor of the Geospatial Information Unit</b>	<ul style="list-style-type: none"> <li>- Follow-up on the application of the national geospatial data model for the collection of relevant national geospatial data, its exchange, sharing, archiving, update, maintenance and dissemination through the national geospatial platform (NGP).</li> <li>- Supervise the processes of collecting, reviewing, classifying, organizing and saving all national geospatial data in case the entity's role is geospatial data producer</li> <li>- Follow-up on periodic assessments on geospatial data quality to ensure commitment to approved standards, policies and regulations.</li> <li>- Supervise the management of national geospatial databases to ensure easy retrieval of geospatial information, its update, and managing the way geospatial information is organized and improving it.</li> <li>- Follow-up on the application of mechanisms, policies and service level agreements for geospatial data to determine the geospatial data that is shared and displayed on the NGP and supports the processes of requesting, exchanging and sharing geospatial data and information interactively among different parties (public / private and local / international).</li> <li>- Supervise the processes of applying standards, rules and regulations, specifications and guidance approved by GEOSA.</li> <li>- Follow-up the processes of implementing policies for data classification, management, and updating them on a regular basis, keeping pace with local and global changes and in accordance with international best practices.</li> <li>- Implementing the governance of the national foundation geospatial layers (Foundation Themes) with the participation of all concerned stakeholders.</li> <li>- Adopting emerging technologies and projects in the field of geospatial artificial intelligence (GeoAI).</li> <li>- Adopting all types of geospatial data analysis processes (geospatial, census, Spatial analysis, image analysis, network analysis, land surface analysis, temporal analysis spatially) using a variety of tools and techniques to use in making better informed decisions.</li> <li>- Ensuring keeping pace with modern technologies and leading practices in providing artificial intelligence and similar technologies in the Sector in general and GEOSA in particular.</li> <li>- Leading the implementation of procedures and policies and legislation to maintain the confidentiality and security of geospatial information and follow up on implementation. This is to identify illegal activities and prohibit them or reduce their impact.</li> <li>- Supervising the preparation and development of effective monitoring plans and following up on the implementation of procedures and Security controls to protect geospatial data from various threats, tampering, or access Unauthorized</li> <li>- Follow up on geospatial security audits and prepare reports, conducting periodic studies on the threats and risks that threaten geospatial security and submitting them to the relevant management to take the necessary decisions</li> <li>- Monitor, analyze and evaluate all activities and operations of systems, applications, networks and locations Work with the entity, identify and classify any geospatial exposures, and provide recommendations and instructions for processing those exposures with the aim of reducing the possibility of exploiting those exposures in any way or manner that negatively affects national security</li> <li>- Ensuring attendance at awareness programs and training courses provided by GEOSA on national geospatial security.</li> </ul>	<ul style="list-style-type: none"> <li>- Bachelor's degree in information systems, or information technology, or survey engineering, or any other related discipline</li> <li>- Professional certification in the relevant field is an advantage.</li> <li>- 15+ years of experience in the field of geospatial data or any related field, including the last 4 years in a leadership position</li> <li>- Knowledge in geospatial systems, pertinent technologies, policies, standards and regulations</li> <li>- Proficiency in Arabic and English</li> </ul>
